

For a happy future,

Weather and climate have great importance for the sustainability of the ecological system. We have to understand the atmosphere better and make plans following atmospheric conditions to ensure health, welfare, and enjoyment in today's and tomorrow's world. The atmosphere is a complex chain of events. Many phenomenons, from a butterfly flapping its wings or a particle emission in the air to the activation of a volcano, can determine the course of the systems in the atmosphere.

Developments in science and technology; especially the advances in the world of computer and informatics, the use of communication and statistical studies in all areas of our lives increase the quality and quantity of atmospheric studies. In parallel with the increase in atmospheric research, it has emerged a need to increase the number of platforms on which results can be published. The Journal of Research in Atmospheric Science provides an open-access platform for researchers to share their works. We are waiting for your contribution to our journal that is accessible to everyone with your studies about the atmosphere. Also, we give importance to the support of the experts in atmospheric sciences by refereeing the evaluation of the studies sent to our journal.

The Journal of Research in Atmospheric Science has begun its publishing life to share the studies in atmospheric sciences and to conduce toward new researches and to ensure a quality life. The articles in the journal are going to be published twice a year; in December and June. We wish that the goodness of humanity and the ecological systems will be regarded in the studies sent to our journal. May it be good and lucky.

Editor in Chief

Prof.Dr.Hüseyin TOROS
